After 10 years of careful planning, Tudor Place has developed a strategy to bring America’s story to life into its third century. The resulting Master Preservation Plan serves as a clear guide to Tudor Place’s future.

The Third Century Capital Campaign was launched to achieve the goals of the Master Preservation Plan. Through this campaign and with the generous participation of donors, members, friends and visitors, we will raise the funds necessary to secure Tudor Place’s future.

The Master Preservation Plan addresses the significant challenges we face as stewards of this National Historic landmark. Challenges include threats to the physical integrity of the historic house, 18,000+ piece Collection & Archive, and 5 ½ acre landscape.
Garage Facility

Collections
Storage

Discrete, underground storage will provide a secure, climate-controlled space for over 18,000 collection objects and archive ephemera not on view at the historic house. With proper storage, the Collection & Archive will be more accessible to staff, scholars and researchers.

Greenhouse &
Garden

The current hoop greenhouse will be replaced by a permanent greenhouse structure with attached workroom. This space will provide added protection for the site’s more sensitive plants during the winter months and growing space for raising historic seedlings.

Exhibition
Gallery

A climate-controlled gallery area will display rotating exhibitions that explore varied facets of American history and culture in all its diversity, showcasing a wider range of the Collection & Archive.

Education
Space

Enlarging the space for educational programs & events will address the growing number of school age children who can and do visit Tudor Place annually, and accommodate larger audiences of life long learners for lectures & presentations.

Mechanical Plant

The climate control system for the Garage Facility and the Historic House will run on geothermal energy, with the mechanical plant located beneath the Garage Facility.
